

## Palindrome

```
class Palindrome{

    // Function to check if a string is a palindrome
    static void isPalindrome(String s) {
        int left = 0;
        int right = s.length() - 1;

        // Continue looping while the two pointers
        // have not crossed
        while (left < right) {

            // If the characters at the current positions
            // are not equal
            if (s.charAt(left) != s.charAt(right)){
                System.out.println("Not a Palindrome");
                return;
            }

            // Move the left pointer to the right and
            // the right pointer to the left
            left++;
            right--;
        }

        // If no mismatch is found, return (palindrome)
        System.out.println(s+" is a Palindrome");
    }

    public static void main(String[] args) {
        String s = "abba";
        isPalindrome(s);
    }
}
```

## Output:

**Palindrome**
